МИНИСТЕРСТВО ОБРАЗОВАНИЯ РЕСПУБЛИКИ БЕЛАРУСЬ
УЧРЕЖДЕНИЕ ОБРАЗОВАНИЯ
“БРЕСТСКИЙ ГОСУДАРСТВЕННЫЙ ТЕХНИЧЕСКИЙ УНИВЕРСИТЕТ”

ФАКУЛЬТЕТ ЭЛЕКТРОННО-ИНФОРМАЦИОННЫХ СИСТЕМ

Кафедра интеллектуальных информационных технологий

ОТЧЁТ ПО ЛАБОРАТОРНОЙ РАБОТЕ №6

По дисциплине “Системное программирование”

Специальность “Программная инженерия”

Выполнил:
А.С. Кот
Студент группы ПО-13
Проверил:
А.Д. Кулик
преп.-стажёр кафедры ИИТ

Брест 2026

Цель: освоить приемы тестирования кода на примере использования пакета pytest.

Задание 1: Написание тестов для мини-библиотеки покупок (shopping.py).

5. Добавьте поддержку купонов:

def apply_coupon(cart, coupon_code):
    coupons = {"SAVE10": 10, "HALF": 50}
    if coupon_code in coupons:
        cart.apply_discount(coupons[coupon_code])
    else:
    raise ValueError("Invalid coupon")

• Напишите тесты на apply_coupon

• Замокайте словарь coupons с помощью monkeypatch или patch.dict

Задание 2:

Напишите тесты к реализованным функциям из лабораторной работы №1. Проверьте тривиальные и граничные случае, а также варианты, когда может возникнуть исключительная ситуация. Если при реализации не использовались отдельные функции, необходимо провести рефакторинг кода.

Задание 3: Написать тесты к методу, а затем реализовать сам метод по заданной спецификации.

1) Реализуйте и протестируйте метод String repeat(String pattern, int repeat), который строит строку из указанного паттерна, повторённого заданное количество раз.

Спецификация метода:

repeat ("e", 0) = ""

repeat ("e", 3) = " eee "

repeat (" ABC ", 2) = " ABCABC "

repeat ("e", -2) = ValueError

repeat (None , 1) = TypeError

1)

```
# shopping.py
class Cart:

```
# string_repeat.py
"""
Module providing string repetition functionality
"""

def repeat(pattern, repetitions):
    """
    Build a string by repeating the specified pattern a given number of times.

    Args:
        pattern (str): The pattern to repeat (must be a string)
        repetitions (int): Number of repetitions (must be non-negative integer)

    Returns:
        str: The repeated pattern concatenated together

    Raises:
        TypeError: If pattern is not a string or repetitions is not an integer
        ValueError: If repetitions is negative

    Examples:
        >>> repeat("e", 0)
        ""
        >>> repeat("e", 3)
        "eee"
        >>> repeat(" ABC ", 2)
        " ABCABC "
        >>> repeat("e", -2)
        Traceback (most recent call last):
        ...
        ValueError: repeat count must be non-negative
        >>> repeat(None, 1)
        Traceback (most recent call last):
        ...
        TypeError: pattern must be a string
